#### **TERM OF REFERENCE :**

### The science and research behind activities

#### 1. Weather control

There are powerful sonar pulses emitted from technologies such as HAARP through strategically located towers in Australia as well as possibly Pine Gap that are deliberately interfering with our weather, preventing rain from reaching the continent and causing severe drought leading to the bushfires.

This phenomena must be known by some bodies in the Federal government under cover of secrecy. The technology must be switched off. This requires a scientific appraisal and investigative research.

#### 2. Arial spraying

It was noted by several communities in NSW that arial dumping of tiny plastic particles was done just before the recent outbreak of fires this season. These particles fell into dams, hence could be noticed as particularly unusual. Some people had them tested and found they had the qualities of 'sparklers' such that when the fires came, they would assist the intensity of incineration.

Whoever authorises these arial sprays, referred to largely as 'chem trails' because of the streaks of white trails left in the sky, needs to be investigated and held accountable.

Our efforts to prevent, fight and control fires are useless when there are deliberate counter efforts and espionage whose purpose is unknown, at least to the public.
