“I write in opposition of all wind farms.

I have studied the cost and efficiency of both rural and marine installations.

There can be no doubt that the efficiency of wind farms is at best marginal and averaging to extremely poor. Many claim efficiencies of well less than 20%.

This makes for an enormously expensive contribution to carbon management – if this was a provable requirement!

No mention is made of the high cost of maintenance of wind farms?

No mention is made of the failure of some installations of wind farms?

Thermal power has some potential if resources are challenged.

Solar technology appears to be making rapid technological improvements and may one day provide an alternative generating force

Thank you for your consideration

Tom Green
