

Air Commodore Ron Tilley Director General Capital Facilities and Infrastructure

#### Mr Graham Perrett MP

Chair Parliamentary Standing Committee on Public Works Parliament House CANBERRA ACT 2600

Dear Mr Perrett,

# DEPARTMENT OF DEFENCE'S RESPONSES TO QUESTIONS ON NOTICE FROM THE PUBLIC HEARING: FISHERMANS BEND REDEVELOPMENT PROJECT

- 1. I am writing in response to questions taken on notice during the Public Works Committee's Public Hearing into the Fishermans Bend Redevelopment Project on 16 August 2023.
- 2. The Department of Defence's responses to the questions, as recorded in the Hearing transcript, are detailed in Enclosure 1.
- 3. Please do not hesitate to contact me if you require any further information.

Yours sincerely,

#### **RM Tilley**

Air Commodore Director General Capital Facilities and Infrastructure

29 August 2023

### **Enclosure:**

1. Department of Defence's responses to Questions on Notice from the Public Hearing: Fishermans Bend Redevelopment Project

Serial	Committee Member	Question	Defence's Response
2.	Mr Zappia	Would it be possible for you to provide that information (how many employees work at the DST group site) to the committee, in terms of the actual numbers a decade ago?	In 2013 there were 737 Australian Public Servants working at DSTG Fishermans Bend. Defence does not have information relating to the number of site-based contractors working on the site in 2013.
3.	Mrs Andrews	(a) Could I ask you to review existing state government policies in relation to natural gas for industrial purposes and advise the committee of your views in relation to any potential impact on this project.	On 28 July 2023, the Victorian Government announced that from 1 January 2024, planning permits for new homes and residential subdivisions will only connect to all electric networks, with houses taking advantage of more efficient, cheaper and cleaner electric appliances. As part of the announced changes, the Victorian Government will also build all new government buildings as all-electric, including new schools and hospitals.  The project scope does not include any new buildings, except for the fire water tank and pump compound and the front entry precinct guard box. These new buildings will not be fitted with a natural gas connection. The replacement of existing gas-powered plant and equipment within the site does not form part of the project scope.  The relevant project scope, being the replacement of existing in-ground natural gas reticulation systems, complies with the Victorian Government policy. It is anticipated that in time, existing gas-powered building services on the site will reach the end of their useful life and be replaced by electric appliances, which is in line with the new Defence Net Zero Strategy policy. Notwithstanding this, the replacement of in-ground natural gas reticulation systems has an enduring requirement to support some gas-powered specialist equipment at the DSTG Fishermans Bend site, as there is currently no viable electric alternative.

Serial	Committee Member	Question	Defence's Response	
		(b) Is it possible to repair and maintain the natural gas pipeline?	The natural gas supply pipework is in a poor condition and, based upon site inspections by the Managing Contractor and the design engineers during design development, repairing and maintaining the natural gas pipeline in its current deteriorated state is not recommended due to safety and operational reasons.	
			Safety issues that could become evident with a failing natural gas reticulation network include leaking gas infrastructure (both internal and external to buildings) which has a risk of inhalation by personnel and/or the chance of an explosion. As the current natural gas infrastructure system is in a poor and deteriorated condition, it cannot be relied upon to support DSTG's operational needs for supply of natural gas.	
		(c) How long can the existing natural gas pipeline be maintained?	The industry standard for the design life of a natural gas pipeline is 30 years. The natural gas pipeline network at the site is approximately 50 years of age.	
			There have been two failures of the natural gas pipeline in the last two years, both as a result of corrosion in the pipeline. Based on the age of the network, it is expected that the frequency of failures will increase as the network continues to deteriorate.	
			Continuing the reactive maintenance approach will result in an increased safety risk, increased maintenance costs and increased downtime across the network, which will negatively affect DSTG's ability to deliver its core business.	
		(d) What is the cost per annum of maintaining the existing natural gas pipeline?	The annual cost of inspections of the natural gas reticulation system is approximately \$13,000. The cost of two reactive maintenance tasks (gas leaks) during the last 2 years was approximately \$17,500.
