I sat on UNCTAD UNFCCC UNCCD global assemblies from 1996 -2001 designing best approaches to lower CO<sub>2</sub>e without impact to national economies.

\*Coal fired power stations are de-facto volcanoes emitting nox sox to the atmosphere to become nitrogen and sulphates for living matter to breathe or sequester.

\* The Carbon cycle has stalled the CO<sub>2</sub>e build-up remains a potential global cooling event

\* To charge industry to discover clean energy overnight is not the way. To apply a tax that will ultimately directly or indirectly be funded by the public at large is un-researched. A tax needs a service or produce.

- The nation is facing a multi facet problem of loss of overseas markets with a high tax, QANTAS paying Euro emission tax,
- rising un-employment and, an Australian carbon tax without comprehending climate change cause effect solution.

The parliament needs to change direction comprehend Climate Change cause effect and indeed best solution.

CO<sub>2</sub> build up is reaching global cooling levels as sun is blocked out. Several cases already Southern China industrial city in tropic infrastructure severely damaged as freeze hit for 5 days. Projection for Australia a constant wet if CO<sub>2</sub> build up continues.

Demanding industry switch to gas is a long-term project and little to now impact lowering CO<sub>2</sub>e.

Based on extensive attendance at these UN assemblies setting low cost solutions there is a better way.

Nature recycles volcano emissions back to nitrogen sulphates et al gases for living matter to breath and sequester.

Google will attest to my work in lowering CO<sub>2</sub> and reversing deserts restarting Carbon cycle rain and essential element cycles building soil etc in deserts

It needs planning but it can engage many in new jogs careers (Roosevelt) Unemployed et al back paying taxes best of all

Carbon trading funds all and indeed monies to develop clean energy such as the Australian technology Browns gas stoichiometric hydrogen

UNCTAD and UNFCCC allowed 70years for the world to give up on coal-fired energy.

Allow me 16 minutes presentation an overhead or like and I will demonstrate Climate change is a income generation not a treat to national and export

economy. Significant CO2 reduction in a year, forward sell CO2 offsets self-funding. All has been thought through
