

I would like to submit my disagreement with patenting genes.

This will cause restrictions in research and medical advancements.

How can this be done, if I and many others have the same gene that exists without being manufactured, or designed or created. Who is the creator of these genes? They already exist.

You can not patent something that everyone already has that you have no involvement in its existence.

this is outrageous and will not benefit anyone or future research.

If the breast cancer gene is patent can I sue the owner (who has patent it) I dont want it, who is responsible for that gene, the owner? Who is the owner of an existing gene?

Please do not let human genes be patent.

thank you

Lin Stuart
