Ag. Fisheries & Forestry Committee.

The most important pest that farmer have to contend with ignorant & corrupt research personal & politicians, there are plenty of instances of them claiming that trees are each using 200 litres a day & more with a plantation rate at 1000 trees a hectare that is 22 milimetres a day or 8360 milimetre a year. The same experts claim that removing cattle from the river marshes will reduce the phosphat & nitrogen & will enclose a copy of a table that proves the opposite, that is that cattle harvest the nutriment that the waterbirds bring in. The owner of freehold land have a clear title to use the land for their own benefit so if the Gov. wants landowner to feed native animals they should pay for the damage they do

Yours faithfully

R W Threadgold
