

SUBMISSION NO. 75

RAIN SERVER SYSTEMS

Rain Server Systems is a very cost effective way of eliminating the need for town water supply to landscaping. Whether it be in domestic, Commercial or Industrial situations.

Rain Server Systems can be easily installed into any downpipe to capture and distribute at a controlled rate part, or all of the rain water currently being wasted by going down the stormwater system.

Watch the plants grow.

Watch your excess water bill disappear

We have a working model where we have installed this system into an existing home on the Gold Coast. This has been a job in progress during the last eleven months.

We invite yourself or your representative to view this working model with all the benefits clear.

Healthy Plants

No Town Water Supply needed.

Pollution and dust etc. washed in the garden, not environment

It has been made very clear lately that we must conserve on town water supply.

We believe what we have goes a long way towards achieving exactly that, but do not possess the finance to develop this to its full potential. We are looking for people or departments who see the need for this type of system with the view to helping develop the system to its full potential.
