

I had a friend die at 47 of suicide. I believe he had a lack of the hormone testosterone in his body as he showing symptoms of this.

I wonder if also, that could be an indication with young males, that they commit suicide because of depression associated with fluctuating testosterone levels.

Maybe it would be an idea to do a blood test for testosterone levels in all male suicides to see if this is a contributing factor ie that low levels of the hormone are found in a high number of male suicides and perhaps could be treated.

Kind regards

Nancy Kendrick
