

I live in the Northern Territory: indebted to it's natural beauty and fed by hundreds of thousands of international tourists that visit here every year; purely for it's beauty, clean environment and it's vast wildness.

In a world that too often seeks an easy nuclear answer to a real and impending energy crisis, could not the Northern Territory be asked to harness the 360 days/year it receives of pure sunlight to help resolve the world's energy needs, rather than take on the toxic and tragic potential of the world's nuclear waste?

What a waste a nuclear dump would be

Could we get serious about harnessing and sharing the clean, clean energy supplied to us daily and freely from the greatest nuclear reaction there has ever been..
