

To Whom it may concern

I would like to put my 2 cents in & agree with the idea of a national feed in tariff. If we are serious about greenhouse emissions it is time we have a unified approach to this (that means national). A gross tariff would be reasonable. Coal producers don't currently pay enough for their pollution. Solar pv systems provide hidden benefits to our communities but reducing the need for new infrastructure & reducing the stress on existing systems so why shouldn't they get compensated.

Let have some action please & not more hot air (don't get me started on the river system !!!!!)

Kind Regards,
Mark England
