

Dear Members of the Committee

I consider that the fitting of solar cells, along with whole move away from coal and oil should have happened 30 years ago. After all, we do not live on an Infinite Earth, although Economics and our Lifestyles will tell you it is. Therefore, whatever is being done now, should be done with a sense of utter urgency. As if the air we breath matters. As if it was a crime to pollute and to profiteer from the export of Coal for others to pollute.

Much beyond an \$8,000 rebate, we need a sense of urgency strong enough to use even the military to help deliver enough solar to supply the needs of this Sun Blessed Country.

Please do it yesterday. Subsidise it, think of it as urgent, get it done.

Australia can lead the World by example in this shift away from an Infinite Earth Carbon Economy, towards a necessarily less anthropocentric, more biocentric future.

- Solar Power the country urgently;
- Start global discussions on Human Responsible Breeding;
- While there is affordable Oil, retrofit and prepare for when there isn't;
- Move Australia towards the 100km diet: All we eat is sourced within 100km;
- and so much more...

Thank you for your attention and providing this opportunity for feedback.

Best Regards

Yours Faithfully

Luis Sanches
