Solar Energy is a critical way to reduce household Carbon consumption.

The impact of solar panels on a large percentage of house and business roofs would be a simple, powerful and cost effective way to reduce our nations greenhouse gases.

It would manage future price rises by giving people access to low cost energy and would also enable key industries to ensure their energy through the grid.

It is a win win for all.

The governments role in encouraging this is critical. It can enable householders to take control of their greenhouse impact rather than feeling beholden to large organizations. Empowerment is a key part of this process.

Please enable householders to reduce their own impact on the environment, to produce cheap and green energy and to aid the future economy.
